                                                                                                                                                                                                                                                                                                                                                           Submitted (APR-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
ENVIRONMENTAL CONDITIONS (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               111 AKKVAK--KAPAKKATKAAKKAATKAPAKKAATKAPAKKAVKATKSPAKKVTKAVKKTAV 168

Submitted (DEC-1997) to the SWISS-PROT data bank.
-!- FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
ENVIRONMENTAL CONDITIONS (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         111 AKKVAK--KAPAKKATKAAKKAATKAPARKAATKAPAKKAATKAPAKKAVKATKSPAKKV 168

"The Drosophila hydei gene Dhmstlol(1) encodes a testis-specific,
"The Drosophila hydei gene Dhmstlol(1) encodes a testis-specific,
repetitive, axoneme-associated protein with differential abundance in
Y chromosomal deletion mutant files.";
Dev. Biol. 162:414-425(1994).
-!- FUNCTION: POSSIBLE STRUCTURAL ROLE IN THE SPERM TAIL. IT IS
ASSOCIATED WITH AXONEMAL STRUCTURES.
-!- SUBCELLULAR LOCATION: CYCOPIAGMIC (By similarity).
-!- TISSUE SPECIFICITY: TESTIS. LOCATED IN SPERMATOCYTES AND
                                                                                                                                                                                             smegmatis.";
Mol. Gen. Genet. 260:475-479(1998).
Mol. Gen. Genet. 260:475-479(1998).
-! FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
ENVIRONMENTAL CONDITIONS (BY SIMILARITY).
-! SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.

Cell. Biol. 7:478-485 (1987).
-!- FUNCTION: HISTONES H1 ARE NECESSARY FOR THE CONDENSATION OF NUCLEOSOME CHAINS INTO HIGHER ORDER STRUCTURES.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SIMILARITY: BELONGS TO THE HISTONE H1/H5 FAMILY.
                DOMAIN: THE PREDOMINANT STRUCTURE IS ALPHA-HELICAL. POLYMORPHISM: THE NUMBER OF REPEATS VARIES BETWEEN STRAINS.
                                                                                                                                                                                                                                                                                                                         23;

The primary structure of histone H1 from sperm of the sea urchin Parechinus angulosus. 2. Sequence of the C-terminal CNBr peptide and TT free entire primary structure.";

The entire primary structure.";

Eur. J. Biochem. 104:567-578 (1980).

-1- FUNCTION: HISTONES H1 ARE NECESSARY FOR THE CONDENSATION OF NUCLESSOME CHAINS INTO HIGHER ORDER STRUCTURES.

-1- SUBCELLULAR LOCATION: Nuclear.

-1- SINGELLULAR LOCATION: Nuclear.

                                                                                                                                                                                                                                                                                                                                                  SEQUENCE OF 80-248.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 AKKYAKKEKAYAKKAEKAAK-KAEAKAYKAAEAKKKAKAEAKKYA-KAAKAEKKEYAAAE 58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

Gavino V.H., Fallon A.M.;

"Aedes mosquitoes ribosomal protein S6 cDNA.";

Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: MAY PLAY AN IMPORTANT ROLE IN CONTROLLING CELL GROWTH

AND PROLIFERATION THROUGH THE SELECTIVE TRANSLATION OF PARTICULA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CLASSES OF MRNA (By similarity).
-!- PTM: Ribosomal protein S6 is the major substrate of protein kinases in eukaryote ribosomes (By similarity).
-!- SIMILARITY: BELONGS TO THE S6E FAMILY OF RIBOSOMAL PROTEINS.

```
AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glather actate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or mutibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune haemolytic purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Gillain-Barre's syndrome, Hashimoco's disease, dilapathic myxoedema, myasthenia gravis, psyndrome, Hashimoco's disease, idiopathic myxoedema, myasthenia gravis, psyndrome, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft isease, graft-versus-se, and delayed-type hypersenaitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to molecular accate molecules, which makes them ideal for use as
                                                                                                                                         Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                                                                               Claim 10; Page 14; 72pp; English

AAY82576 standard; peptide; 86 AA. AAY82576; 

Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:6.

(first entry)

28-JUL-2000

Copolymer; molecular weight marker; TV-marker; immune disease; glatiframer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidiabetic; thyromimetic; hemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; condition; multiple sclerosis; rheumatoid arthritis; condition; multiple sclerosis; rheumatoid arthritis; choin's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis; pemphigus vulgaris; systemic lupus erythematosus.

Unidentified

glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidiabetic; thyromimetic; haemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis;

Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:7.

28-JUL-2000 (first entry)

AAY82577;

Copolymer; molecular weight marker; TV-marker; immune disease;

. WO200018794-A1.

```
AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides (I) for determining the molecular invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight cand an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple concertaintis, autoimmune thyroiditis, autoimmune haemolytic anaemia, autoimmune cophoritis, outcoimmune thrombocytopaenia uveoretinitis, crohn's disease, chronic immune thrombocytopaenia uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves (Dupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-staft diseases, gasembicus, psoriasis, psoriasis, pemphigus vulgaris, or systemic include host-versus-staft disease, gasethy disease, and delianed molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as
                                                                                                                                                                                                                                                            molecular weight markers for prevention of immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9; Gaps

Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:4.

28-JUL-2000 (first entry)

Copolymer; molecular weight marker; TV-marker; immune disease;

```
AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune attibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, theumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinits, crohn's disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves diseases, Gullain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psemphigus vulgaris, or systemic lund, a betreated mediated mediated diseases which can be treated in the contact sensitivity diseases which can be treated in the contact sensitivity diseases which can be treated in the contact sensitivity diseases which can be treated in the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the contact sensitivity diseases which can be treated to the cancact sen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

Claim 10; Page 14; 72pp; English

```
weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple scleonis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic uveoretinitis, Crohn's disease, fundic immune thyroiditis, autoimmune uveoretinitis, crohn's disease, chonic immune thyroiditis, autoimmune purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriaais, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    include host-versus-graft disease, graft-versus-host disease, and delayed-vype hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels 11; Gaps

antibody-mediated diseases uch diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune purpura, contaits, Crohn's disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, dilabetes mellitus, Graves disease, dilabetes mellitus, Graves disease, dilabetes mellitus, Graves include host-versus-graft gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypoptides of the invention have defined molecular weights and physical properties which are analogous to glatirame acctate molecules, which makes them ideal for use as AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acceate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases thich may be treated include either cell-mediated or site. molecular weight markers

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The sequences AAA3633-A3652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver concleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgonic animals (as models or human carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in clude transforming cells to produce proteins, or transfecting cells in clude transforming cells to produce proteins, or transfecting cells in include transforming cells to produce proteins or transfecting cells in the include the cellular capacity of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognises and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytosis of the cell. The NTS can be used to treat disorders by targeting of specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting especific expression into specifically targeted tissue culture cells. The lysis agent within the NTS avoids the problem of endosomal/lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                          Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents poly-Lys-Ala, used to bind nucleic acid in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules is used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid transport; cytosis; ligand; lysis agent; spacer molecule; gene therapy; hepatocyte; muscle; bone forming cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model -

                                                                                          AAR06445
                셤
                                                                                                             This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid. The mucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can carbo be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor appressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                         Nucleic acid delivery; nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor autigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen.
Nucleic acid transporter system for delivering nucleic acid into a cell, useful for delivering proteins and polypeptides to cells, including growth factors, enzymes, hormones, and tumor suppressors
                                                                                                                                                                                                                                                                         Nucleic acid transporter system peptide ligand SEQ ID NO 64.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WOO SLC;

To improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 2-NOV-1984 US4691009, NREL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences. Cequences, originating from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein. rCOP-1-77 contains oligonucleotide duplexes incoding the following segments: YKK, ARK, AKK, and AAA. The N-terminal alamine residue is left behind following CNBr cleavage of the fusion protein. The product prevents or arrests experimental autoimmune control a checkhalowyelitis. They are used to prevent, arrest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12 KKYKKBAEEBEYKKKAKEAERAKKAKYKKKKGAEAAKAAKAAAAAAYKKEAEAAAEAEK 71

The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences. sequences, originating from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein. rCOP-1-19 contains oligonucleocide duplexes incoding the following segments: YKK, AAE, KAK, KKA, YEA, AKA KEA, and AAA. The N-terminal alanine residue is left behind following CNBr cleavage of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The product prevents or arrests experimental autoimmune encephalomyelitis. They are used to prevent, arrest or control ademyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diets deficient in certain amino acids.

AAR84565-R84569 are polypeptides of the TCR27 protein of T.cruzi
The proteins are all fusion products with glutathione-5-transferase
(GST) and some contain a linker sequence. The TCR27 protein comprises
(GST) and some contain a linker sequence. The TCR27 protein comprises
(GST) and allow the company of a highly conserved 14 as sequence and a 68 as C-terminal region. This sequence encodes the GST sequence, the Ag44 polypeptide contg. 16 of the 69
(CC repeat units and also contains the amino and carboxy terminal
(CC the diagnosis of Chagas disease (American Trypanosomiasis), they are capable of detecting anti-T.cruzi antibodies; or for blood screening. The TCR27 protein has epitopes to which most T.cruzi
(CC are capable of detecting anti-T.cruzi antibodies; or for blood screening. The TCR27 protein has epitopes to which most T.cruzi
(Infected individuals have antibodies. The TCR27 polypeptides will not react with serum from patients with leishmaniasis, schistosomiasis,
(CC react with serum from patients with leishmaniasis, schistosomiasis,
(CC automimmune disease and are hence less likely to cause false
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 AKKYAKKEKAYAKKAEKAAKKAEAKAYKAAEAKKKAKAEAKKYAKAAK-AEKKEYAAAEA 59

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glaticamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune CC diseases which may be treated include either cell-mediated or altoimmune CC antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple collerosis, rheumatoid arthritis, osteoarthritis autoimmune hamolytic ansemia, autoimmune opphoritis, autoimmune thyroiditis, untoimmune cophoritis, autoimmune thyroiditis, untoimmune cophoritis, autoimmune thyroiditis, untoimmune cophoritis, autoimmune thyroiditis, untoimmune cophoritis, autoimmune thrombocytopaenia purpura, collitis, contact sensitivity disease, diabetes mellitus, Graves disease, dullain-Barre's syndrome, Hashimoto's disease, aliopathic myxoedema, myasthenia gravis, psyndrome, Hashimoto's disease, and delated-molecular weights and physical properties of the invention have defined molecular weights and physical properties of the invention have constrained acetate molecules, which makes them ideal for use as
                                                                                                                                                                                                                 Copolymer; molecular weight marker; TV-marker; immune disease; glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyvoid; antiinflammatory; antidiabetic; thyromimetic; haemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; Crohn's disease; chronic immune thrombocytopeania purpura; colitis; diabetes mellitus; Graves disease; Gulllain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myashhenia gravis; pemphigus vulgaris; systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                              Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:2.

The MDP1 protein can be used faignosis and treatment of diseases involving pathogenic acid-fast bacteria, such as tuberculosis, Mycobacterium avium intracellular complex (MAC) and Hansen's disease.
                                                                                                                       Mycobacterium bovis BCG strain; mycobacterium DNA binding protein 1;

ARR84565-R84569 are polypeptides of the TCR27 protein of T.cruzi

The proteins are all fusion products with glutathione-5-transferase
(GST) and some contain a linker sequence. The TCR27 protein comprises
(GST) and some contain a linker sequence. The TCR27 protein comprises

C a 95 amino acid (aa) N-terminal region; 69 repeats of a highly
C conserved 14 as sequence and a 68 as C-terminal region. This sequence
c encodes the GST sequence and a 68 as C-terminal region. This sequence
repeat units and also contains a linker sequence. The TCR27
polypeptides of the invention are useful for the diagnosis of Chagas
disease (American Trypanosomiasis), they are capable of detecting
anti-T.cruzi antibodies; or for blood screening. The TCR27 protein
c antibodies The TCR27 polypeptides will not react with serum from
c antibodies. The TCR27 polypeptides will not react with serum from
C patients with leishmaniasis, schistcosomiasis, or autoimmune disease
and are hence less likely to cause false positives in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide(s) from the TCR27 protein of Trypanosoma cruzi - a
immunoassay reagent for specific diagnosis of Chagas disease, also
related nucleic acid and transformed cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

TITLE OF INVENTION: COPOLYMER I RELATED POLYPEPTIDES FOR USE AS MOLECULAR WEIGHT MARK
TITLE OF INVENTION: COPOLYMER I RELATED POLYPEPTIDES FOR USE AS MOLECULAR WEIGHT MARK
TITLE OF INVENTION: WUMBER: US/09/616,989A
CURRENT APPLICATION NUMBER: G0/101,693
PRIOR FILING DATE: 1998-09-25
PRIOR FILING DATE: 1998-09-25
PRIOR FILING DATE: 1999-09-24
NUMBER OF SEQ ID NOS: 7
SOFTWARE: PATENTIN VERSION 3.1
SEQ ID NO 6
LENGTH: 86
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;

Publication No. US20020197265A1

Fubblication No. US20020197265A1

GENERAL INFORMATION:

APPLICANT: Watson, James D.

APPLICANT: Tan, Paul L. J.

TITLE OF INVENTION: Methods and Compounds for the Treatment

TITLE OF INVENTION: Of Immunologically-Mediated Diseases of the Respiratory

TITLE OF INVENTION: System using Mycobacterium Vaccae

FILE REFERENCE: 11000.1008c2

CURRENT APPLICATION NUMBER: US09/156,181

PRIOR FILING DATE: 1998-09-17

PRIOR FILING DATE: 1999-09-17

PRIOR FILING DATE: 1997-12-23

NUMBER OF SEQ ID NOS: 208

SEQ ID NO 201

LENGTH: 223

Application US/09816989A

Sequence 1, Application US 0.00115103A1

APPLICANT: Gad, Alexander

APPLICANT: Gad, Alexander

APPLICANT: Lis, Doris

TITLE OF INVENTION: COPOLYMER 1 RELATED POLYPEPTIDES FOR USE AS MOLECULAR WEIGHT MARK

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

FILE REFERENCE: 2609/60807-A-PCT-US

CURRENT APPLICATION NUMBER: US/09/816,989A

CURRENT APPLICATION NUMBER: 60/101,693

PRIOR APPLICATION NUMBER: PCT/US99/22402

PRIOR FILING DATE: 1999-09-24

NUMBER OF SEQ ID NOS: 7

SOFTWARE: Patentin version 3.1

SEQ ID NO 1

LENGTH: 35

                                                                                                                                                                                                                        JUSTICE 21, Application US/08216894

Patent No. 5876734

GENERAL INFORMATION:

APPLICANT: Kirchhoff, Louis V.

APPLICANT: Kirchhoff, Louis V.

APPLICANT: Grav, Keiko

ITILE OF INVENTION: POLYPEPTIDES FOR DIAGNOSING INFECTION

TITLE OF INVENTION: WITH TRYPANOSOMA CRUZI

NUMBER OF SEQUENCES: 10

CORRESPONDENCE ADDRESS:

ADDRESSES: Foley & Lardner.

STREET: 3000 K Street, N.W., Suite 500

CITY: Washington, D.C.

COMPUTRY: USA

ZIP: 20007-5109

COMPUTRY: IBM PC COMPATION:

MEDIUM TYPE: Flopy disk

COMPUTER: Patentin Release #1.0, Version #1.25

CURENT APPLICATION DATA:

ATTORNEY APPLICATION DATA:

ATTORNEY APPLICATION NUMBER: US/08/216,894

FILING DATE: 24-MAR-1994

ATTORNEY/AGENT INPORMATION:

NAME: BENT, Stephen A.

REGISTRATION NUMBER: 29,768

REGISTRATION NUMBER: 29,768

RELEPHONE: (202)672-5399

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2, Application US/09115746
Patent No. 6228601
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Kirchhoff, Louis V.
APPLICANT: Otsu, Keiko
TITLE OF INVENTION: POLYPEPTIDES FOR DIAGNOSING INFECTION
TITLE OF INVENTION: WITH TRYPANOSOMA CRUZI
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LENGTH: 564 amino acids
TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TELEFAX: (202)672-5399

  AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune becompositis, autoimmune thyroiditis, autoimmune vecetinits, contact sensitivity disease, diabetes mellitus, Graves disease, duillain-Barre's syndrome, Hashimoco's disease, idiopathic myxoedema, myasthenia gravis, permpias, pempiagus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-shost disease, and delayed-type hypersenaitivity. The polypeptides of the invention have defined molecular weights and phylacial properties which are analogous to allowed.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for and an amino acid composition are used as molecular weight markers for golypeptides of the invention are used as molecular weight markers for glatinamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune either cell-mediated or canediated diseases and inflammatory conditions, e.g. multiple campellinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatorid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinits, Crohn's disease, chornic immune thrombocytopaenia purpura, colltis, contact sensitivity disease, diabetes mellitus, Graves disease, dullain-Barre's syndrome, Hashimcto's disease, and inpartic myxoedema, myasthenia gravis, permoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to molecular weights molecules, which makes them ideal for use as
Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA3663-A36652 and peptide sequences AAA98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver once the acids to hepatocytes, muscle cells or bone forming cells, e.g. transporter systems are also used to create transgenic animals (as models for transporter systems are also used to create transgenic animals (as models for thuman carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal
  System for transporting nucleic acid into cells, useful e.g. in gene therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent

The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognises and binds to a cell surface receptor or artigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through cytosis; (c) a nucleic cor (e) a lysis moiety that enables the transport of the entire complex or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS calls of specific acid into the cellular interior as well as the nucleus of specific acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an immal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The Acid are acid as agent within the NTS avoids the problem of endosomal/lysosomal

  The sequence represents poly-Lys-Ala, used to bind nucleic acid in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.

   This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding to a cell, comprising a binding complex comprising a ligand binding conclete acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a cuclear ligand. The complexes are simultaneously bound to the nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, such as hormones, growth factors, enzymes, clotting factors, suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.

The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a control antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (DANCA)-reactive fragment, to form a complex of the histone H1-like antigen, or the pANCA-reacting the presence or absence of the complex, where the presence of the complex; indicates that the subject has UC. The pANCA-reactive histone H1-like antigen are useful in the antigen, porin antigen and Bacteroides antigen are useful in the diagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. The present sequence represents a M. tuberculosis histone H1-like antigen.

   The invention provides a method for diagnosing ulcerative colitis in a subject suspected of having inflammatory bowel disease. The method comprises reacting a patient sample with a porin antigen that is immunologically reactive with pANCA (perinuclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. The present sequence represents a histone H1-like protein of M. tuberculosis, designated 214.

The present sequence represents the Mycobacterium bovis BCG strain mycobacterium DNA binding protein 1 (MDP1), which has immunogenicity against pathogenic acid-fast bacteria. The MDP1 protein can be used for diagnosis and treatment of diseases involving pathogenic acid-fast bacteria, such as tuberculosis, Mycobacterium avium intracellular complex (MAC) and Hansen's disease.
   New Mycobacterium DNA binding protein 1 immunogenic for pathogenic acid-fast bacteria for diagnosis, treatment and prevention of diseases

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   'n.
Gen. Genet. 260:475-479(1998).
FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME ENVIRONMENTAL CONDITIONS (BY SIMILARITY).
SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.
   Histone Hi.11R.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatinamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple callerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune ophoritis, autoimmune thyroiditis, autoimmune veoretinits, contact sensitivity disease, diabetes mellitus, Graves purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, myasthenia gravis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-ses, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to molecular weights markers

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight cand an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune oophoritis, autoimmune thyroiditis, autoimmune cueceinnitis, crohn's disease, formic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, duillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriaais, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers.

  To improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 US4691009, NRLE B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences. It the COP-1 polypeptide may be cleaved from the fusion protein. TCOP-1-7 contains oilgonucleotide duplexes incoding the following segments: YKK, BAE, KAK, and AAA. The N-terminal alanine residue is left behind following CNBr cleavage of the fusion protein.

To improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-19 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 US4691009, NRL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins a methionine residue occurs between the Protein A and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences. Sequences, originating from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein. rCOP-1-19 contains oligonucleotide duplexes incoding the following segments: YKK, AAE, KAK, KRA, PAB, AAA KEA, AAA KEA, and AAA. The N-terminal alanine residue is left behind following CNBr cleavage of the

weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a composition corresponding to the copolymer. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include archritic conditions, antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune ophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves upworetinitis, contact sensitivity disease, diabetes mellitus, Graves upvoretinitis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves include host-versus-sare's syndrome, Hashimoto's disease, indiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated disease which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physpetides of the invention have analogous to molecular weights and physpetides which are analogous to molecular and proper myspecial properties which are analogous to appropriet and properties. AAY82571 to AAY82577 represent specifically claimed copolymer molecular Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases Claim 10; Page 14; 72pp; English molecular weight markers.

```
The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding nucleic acid to a cell. The system comprises a nucleic acid binding nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal

   The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognises and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is apable of moving or initiating movement through cytosis; (c) a nucleic capable of moving or initiating movement through a nuclear membrane; or (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS delivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The Allows again within the NTS avoids the problem of endosomal/lysosomal

   The sequence represents poly-Lys-Ala, used to bind nucleic acid in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, lysis agents, spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic

This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nucleic acid and covalently linked to a nucleic acid and covalently linked to a nucleic acid the nucleic acid transporter system can also be used in a method con the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, and polypeptides, such as hormones, usual antigens, tumor antigens, tumor suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.

The invention provides heat-killed Mycobacterium vaccae, or recombinant

M. vaccae proteins. The M. vaccae proteins may be employed to activate

T cells and natural killer cells, to stimulate the production of

cytokines, to enhance the expression of co-stimulatory molecules on

dendritic cells and monocytes, and to enhance dendritic cell maturation

and function. The proteins can be expressed by standard recombinant

methodology. Pharmaceutical compositions comprising the proteins or

nucleic acid sequences encoding the proteins can be used for the

treatment, prevention, and detection of disorders including infectious

diseases, immune disorders and cancer. In particular, the compounds and

methods are used for treatment of diseases of the respiratory system,

such as mycobacterial infections, asthma, allergies, tuberculosis,

leprosy, sarcoidosis and lung cancers, and disorders of the skin such as

psoriasis, atopic dermatitis, eczema, allergic contact dermatitis,

alopecia areata, and skin cancers such as basal carcinoma, squamous cell

```
AAR84565-R84569 are polypeptides of the TCR27 protein of T.cruzi

The proteins are all fusion products with glutathione-S-transferase

(GST) and some contain a linker sequence. The TCR27 protein comprises

a 95 amino acid (aa) N-terminal region; 69 repeats of a highly

conserved 14 as sequence and a 68 as C-terminal region. This sequence
encodes the GST sequence, the Ag44 polypeptide contg. 16 of the 69

repeat units and also contains the amino and carboxy terminal
peptides of TCR27. The TCR27 polypeptides of the invention are useful

for the diagnosis of Chagas disease (American Trypanosomiasis), they

are capable of detecting anti-T.cruzi antibodies; or for blood

screening. The TCR27 protein has epitopes to which most T cruzi
infected individuals have antibodies. The TCR27 polypeptides will not

react with serum from patients with laishmaniasis, schistosomiasis,

correction.

The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a porin antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a complex of the histone H1-like antigen, or the pANCA-reactive fragment, or presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone H1-like antigen are useful in the antigen, porin antigen and Bacteroides antigen are useful in the antigen, porin antigen and treatment of UC. The methods can also be used for identifying agents useful for treating UC. The present sequence represents a human histone H1 isoform H1.5 pANCA-reactive fragment.

Diagnosing ulcerative colitis or susceptibility, by detecting complex formation between microbial porin antigen and perinuclear anti-neutrophil cytoplasmic autoantibodies -
  The invention provides a method for diagnosing ulcerative colitis in a subject suspected of having inflammatory bowel disease. The method comprises reacting a patient sample with a portin antigen that is immunologically reactive with pANCA (perinuclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. Sequences AAYS7362-367 represent pANCA-reactive fragments, derived from human histone HI.S.
